The technology development of telecommunication, along with the informationization over the world, enables the firms to process their inner and outer works through Electronic Data Interchange (EDI) system. The EDI system has changed the paper works into the electric works. The working processes has been standardized by the EDI system. By standardization of working process, the EDI system reduces the working processes, working time and its costs and, turn out to provide the alternative business opportunity for the firms over the world. This study purposes to empirically analyze the factors affecting the EDI system in the domestic sea product industry.

We compare the case studies on the EDI systems of North America, Europe and Asia countries with each others to identify any differences between the EDI systems of these countries. We also provide
